Hello,

The following submission has been created.

Track Name: NETCRYPT2026

Paper ID: 2312

Paper Title: Face/Mood detection And Environment Analyzation

**Abstract:**

The thing that is really important for intelligence that is centered around humans is to understand how people feel and what is going on around them. This project is about a system that can look at pictures and figure out how someone is feeling and what is around them at the time. The system uses tools that are already trained. One tool is called ResNet18 and it helps the system understand what kind of place it is looking at and the other tool is called DeepFace and it helps the system understand how someone is feeling and how old they are and if they are a man or a woman.

By using these tools together the system can understand a lot about what is going on. It can look at a scene. Understand what is in it and it can also look at someones face and understand how they are feeling. The system is made using something called OpenCV. It can look at live pictures from a webcam and tell us what it thinks is going on. It can even draw boxes around the pictures. Write words on them to tell us what it thinks.

The system is really good at understanding how people are feeling and what is around them even if the light is not very good or if someone is not looking at the camera. It can even understand what is going on if there are a lot of things moving around in the picture. This system is useful for things, like security cameras that can understand what is going on and for computers that can understand how people are feeling and change how they work because of it. Artificial intelligence that is centered around humans like this system can make a lot of things better. The project shows that artificial intelligence can be used to make human-computer interaction systems that're smarter and more aware of what is going on.
